

Ben appears to have:

- 1 A mild concussion: he is woozy, a bit out of it, and has a hard time focusing during your Focused Spine Assessment (FSA).
- 2 A possible spine injury: he could not focus during the FSA.
- 3 An orbital fracture of his left eye: he could not follow your finger and look up on request.

Begin a Level 3 evacuation to the hospital in Durango for physician follow-up. If possible, avoid running any rapids with Ben in the raft to help avoid further injury. If this is not possible, transfer Ben to an oar raft piloted by a senior guide. If you must run a rapid in the paddle raft place Ben in the center of the raft and instruct him to brace and hold on.
