

Heat stroke is your primary concern. If you have a mist bottle, use some of your water to cool each student before proceeding to the next water source. Once there, cool everyone and reassess your route. Given the new moon it will be difficult to travel at night. If you can alter your route to ensure adequate water for drinking and cooling, travel in the early morning, and rest at water during the heat of the day to allow time for initial heat acclimatization to occur, you can consider remaining in the field. Barring a route change, contact your program director and arrange for transportation out of the field or to a new, safer site.
